

Turn your project spec into something your AI can **actually answer from.**

Six steps. About ten minutes. Roughly one dollar.

Install the converter as a skill.

```
npx skills add virgiliojr94/book-to-skill
```

It installs into ~/.claude/skills/ and works with Claude Code, Copilot CLI and Amp. Nothing is uploaded: extraction runs on your own machine.

Check which extractors you already have.

```
python3 scripts/extract.py --check
```

Prose PDFs use pdftotext and finish almost instantly.
Specs with tables, clauses and drawings need docling,
which runs about 1.5 seconds per page.

Point it at the file and pick Technical mode.

```
/book-to-skill ./project-spec.pdf
```

Technical mode preserves tables and numbered clauses. Text mode is faster but flattens them, which is exactly what you cannot afford in a specification.

Know what it built, because that is the whole trick.

You get SKILL.md as a 4,000-token index, plus one file per chapter at about 1,000 tokens each, a glossary, and a cheatsheet. Only the relevant file loads per question.

AI Products Section Head

Ask it a question you already know the answer to.

Ask project-spec about extension of time

Verify it against the clause yourself before you trust it on anything you have not read. First query is a test of the tool, not of the document.

Two things that will make it fail on you.

Chapter detection needs literal Chapter N headings, so specs numbered by section need naming manually. And scanned PDFs must be run through OCR first, or you extract nothing.

Samy Yusif

5k

tokens per answer instead of 119,264 from a raw PDF dump. That is 24x on a small book and 51x on a large one.

Samy Yusif

AI Products Section Head

Do it once on the spec you are working on right now.

A 244-page book costs about 0.88 dollars to convert, 501 pages about 1.23. You pay the structuring cost once instead of paying the search cost on every question.
