

Review a **bill of quantities** with AI without trusting it.

Six steps. One gate. No invented rates.

Samy Yusif

Never paste the whole BOQ. Split it by trade.

One trade, one section, one page range at a time. A long document pushes the model to average across sections, and averaging is exactly what destroys a rate comparison.

AI Products Section Head

Fix the columns, and demand NULL for every blank.

`item, unit, qty, rate, amount, page`

The same six columns whatever the layout of the sheet.
An empty cell must come back as NULL, never as a guess, and never quietly dropped out of the table.

Reconcile the section before reading a line of it.

```
sum(qty x rate) == printed total
```

Row count must equal the printed line count. The sum must match the printed total to the last decimal. Any difference means extract again, not investigate.

Only now ask what you opened the file to ask.

Items missing against the specification, scope duplicated between trades, units that contradict the item, lines priced at zero. One question per pass, not all four at once.

Samy Yusif

AI Products Section Head

Compare each rate to the median of the same item.

```
flag if rate > 1.5 x median rate
```

The median across sections and packages, not the average. One deliberately loaded rate should not be able to move the reference it is being measured against.

Make it cite a page and line for every claim.

A finding with no page number is not a finding. This is what survives a meeting, and what stops an invented item from walking into a negotiation on your side of the table.

Samy Yusif

AI Products Section Head

It will happily price a line that had no rate.

The column pattern says a number belongs there, so a number appears. That single behaviour is why the reconciliation gate comes before the analysis and not after it.

Samy Yusif

0

The only acceptable gap between your extracted total and the printed one. Anything else and the table is fiction.

Samy Yusif

AI Products Section Head

Run it first on a BOQ you priced yourself.

You already know the right answer on that one, so you find out exactly where the extraction breaks before it can cost you anything on a live tender.
